

# Compact Fluorescent Lightbulbs (CFL's)

- CFL's use  $\frac{1}{4}$  the power of regular bulbs for the same brightness
- That is like a car that gets 80 mpg instead of 20 mpg
- CFL's save electricity = save \$\$\$
- CFL's cost more than ordinary bulbs, but pay for themselves after 500 hours of use –about 3 months
- After 500 hours, they save you money  
on every electric bill
- AND they help reduce global warming
